Release X <version number>

Summary of Changes

We are diligently working on improving our platform and developing new features ...

New Features Overview

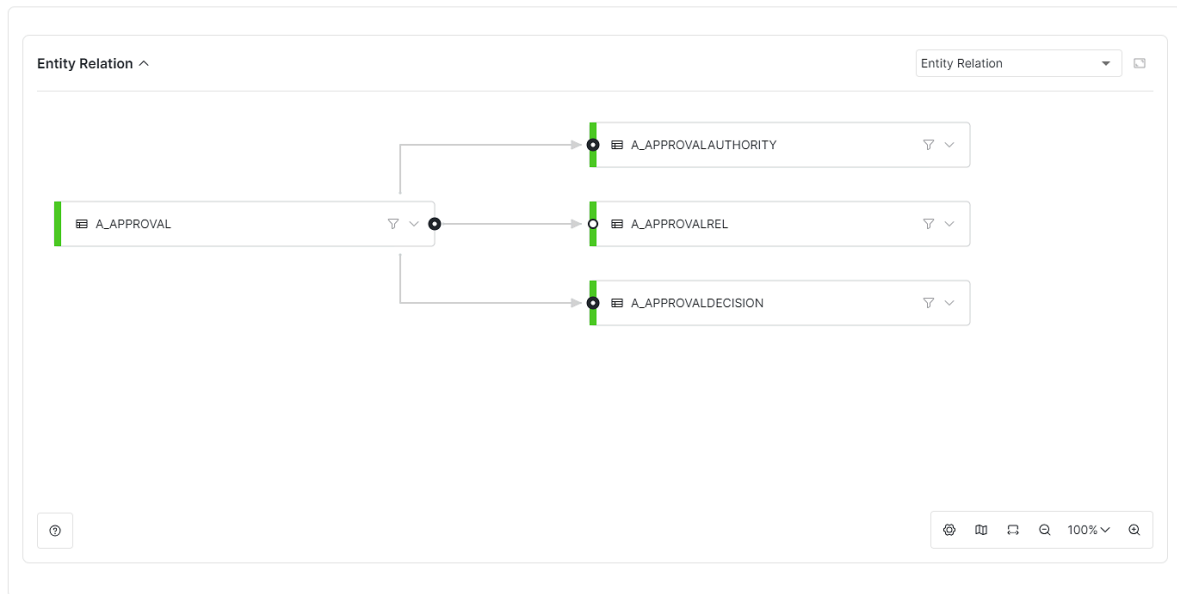

Ingestions

In this release, we're introducing the Ingestion functionality, enabling [administrators](#) to integrate your data into Dawiso. We offer a variety of providers, to which you can connect and subsequently create a data source. We're consistently expanding our integration capabilities. Currently, there are several out-of-the-box metadata scanners and we are in the process of adding more. We're supporting GraphQL querying within the connector.

Entity Relationship Diagram

We have implemented the Entity Relationship Diagram (ERD) as an additional entity representation option. Now, you have more choices for displaying your data. [To understand more about diagrams, please refer to this section](#). The complete Entity Relationship Diagram user guide is currently in progress.

Embedded Diagram

We've enhanced the embedding process. Now you can embed existing diagrams into your text (be it a description, summary, or content) right in the text editor. Simply type a forward slash "/" in the text field to see the available options. Select Diagram, find the desired diagram, and confirm. To learn more about embedding texts and diagrams, refer to our product documentation.

[Learn more →](#)

Data Lineage Diagram

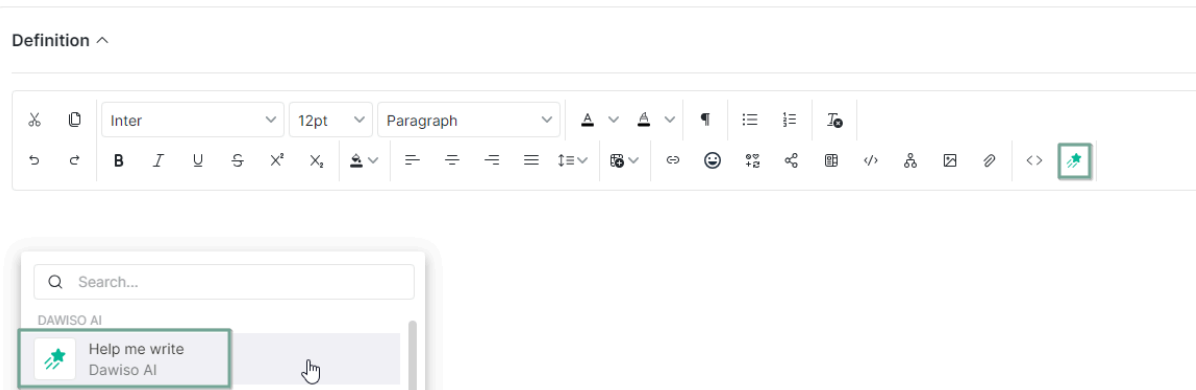

We've added the "Smart expand" feature, which unfolds the diagram as far as possible while ensuring it remains visually pleasing (especially with large branching). In other words, functionality refers to the possibility of expanding certain flows of a diagram to show related entities (such as tables, columns, etc.) as detailed as you need for your work. For this just select the depth.

AI-Powered Writing

- **AI Writing Feature:** We've integrated AI Writing into our Text Editor, accessible via the Dawiso AI icon in the toolbar. This tool provides spell, grammar, style checks and much more.

- **Shortcut Activation:** Initiate AI writing quickly by typing the forward slash "/" in the text field and selecting "Help me write."

- **Toggle Switch for Summary Generation:** A new toggle switch in the text editor enables AI-generated summary texts based on attribute values. Disabling the switch keeps the generated text, allowing for manual editing in the Summary field.

Improvements

Open and Close Panels

To optimize your work experience, we've added the ability to hide the values of certain attributes. For this, there is an arrow next to each attribute. With this improvement, by clicking the upward arrow, the attribute's panel will close, and by clicking the downward arrow, it will reopen... [For more information on the Open and Close Panels functionality refer to our user guide.](#)

Bugs Fixes

We have made the following fixes since our last release notes:

- **Concept** - fixed a bug where the asterisk was missing, indicating that the field is mandatory and must be filled in to save.
- **Attributes** - fixed a bug where an SQL attribute type wasn't formatted correctly when entering SQL query. Now you can see the correct formatting, including the keywords that are color-coded.
- **Copy link** - bug fixed when copying the link and pasting it into the new browser window, the same page will be opened.
- **SQL format** - fixed a bug where an SQL query in the definition is well-formatted.
- **Template** - we have fixed the slowness of editing attributes in a template.
- **Data Lineage** - bug fixed with a deletion in the diagram. To delete, click on Delete on your keyboard or right-click on the object and select Delete. This has to work the same way now.
